Dosen Pengampu:
Royyana Muslim Ijtihadie, S.Kom., M.Kom., Ph.D.

Departemen Teknik Informatika
Fakultas Teknologi Elektro dan Informatika Cerdas
Institut Teknologi Sepuluh Nopember (ITS)
Surabaya
2021

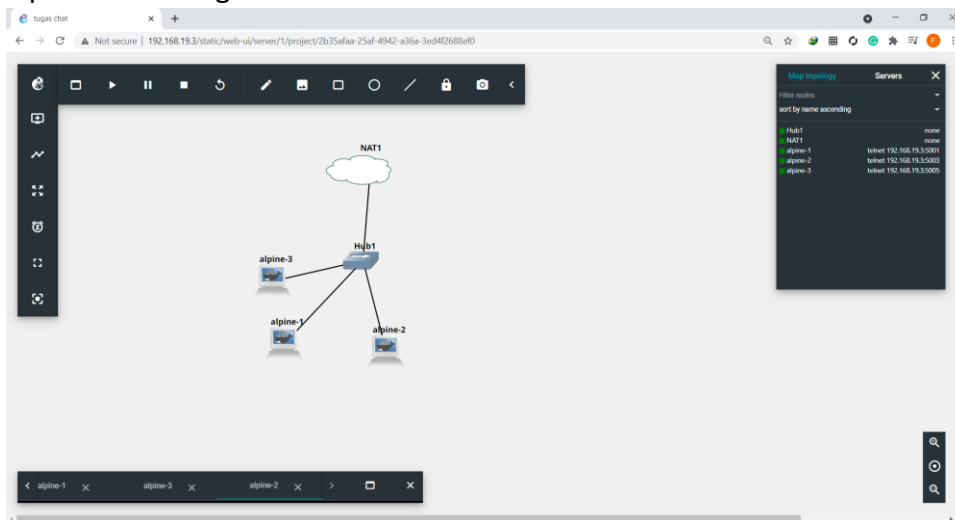

Praktikum

semua tugas berikut ini HARUS dijalankan di SIMULATOR

1. jalankan program server seperti dalam pembahasan
2. buatlah program client yang dapat melakukan 100 request get pada dalam satu saat untuk operasi get file "pokijan.jpg"
3. capture dan submitlah poin 1 dan 2 dalam satu dokumen pdf. berikan DESKRIPSI dan PENJELASAN

Dokumentasi :

1. Arsitektur Jaringan, nantinya alpine-1 akan digunakan sebagai server, alpine-2 dan alpine-3 tidak digunakan

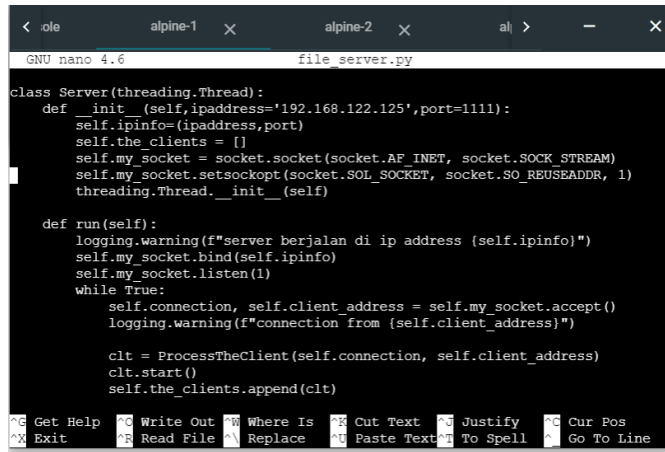

2. Cek ip pada server (alpine-1) dengan command **ifconfig**

```
alpine-1 # ifconfig
eth0      Link encap:Ethernet  HWaddr BA:7F:0F:97:43:07
          inet addr:192.168.122.125  Bcast:192.168.122.255  Mask:255.255.255.0
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:1372 errors:0 dropped:0 overruns:0 frame:0
          TX packets:17 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:87516 (85.4 KiB)  TX bytes:4410 (4.3 KiB)

lo        Link encap:Local Loopback
          inet addr:127.0.0.1  Mask:255.0.0.0
          inet6 addr: ::1/128 Scope:Host
          UP LOOPBACK RUNNING  MTU:65536  Metric:1
          RX packets:0 errors:0 dropped:0 overruns:0 frame:0
          TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:0 (0.0 B)  TX bytes:0 (0.0 B)

/home/Pemrograman_Jaringan_E/progjar4a #
```

3. Pada server (alpine-1) buka folder progjar4a, lalu ubah file **file_server.py** sesuaikan dengan ip alpine-1. Ada 2 line code yang harus diubah yaitu pada **class Server(threading.Thread)** dan pada **main**

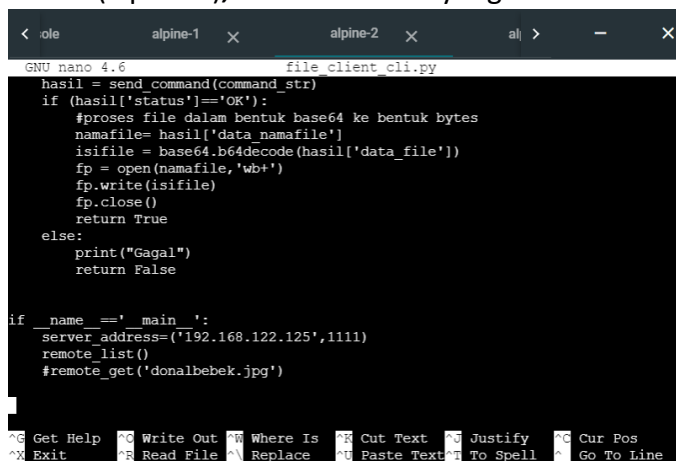

```
GNU nano 4.6 file_server.py
class Server(threading.Thread):
    def __init__(self,ipaddress='192.168.122.125',port=1111):
        self.ipinfo=(ipaddress,port)
        self.the_clients = []
        self.my_socket = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
        self.my_socket.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEADDR, 1)
        threading.Thread.__init__(self)

    def run(self):
        logging.warning(f"server berjalan di ip address {self.ipinfo}")
        self.my_socket.bind(self.ipinfo)
        self.my_socket.listen(1)
        while True:
            self.connection, self.client_address = self.my_socket.accept()
            logging.warning(f"connection from {self.client_address}")

            clt = ProcessTheClient(self.connection, self.client_address)
            clt.start()
            self.the_clients.append(clt)

if __name__ == '__main__':
    server = Server('192.168.122.125',1111)
    server.start()
    remote_list()
    #remote_get('donalbebek.jpg')
```

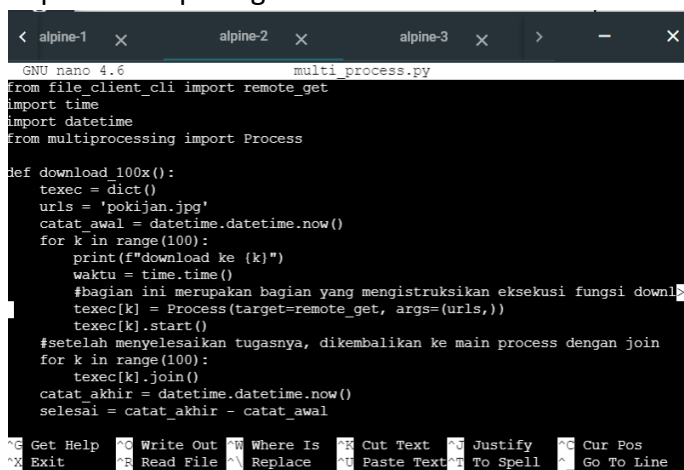

4. Pada client (alpine-2) ubah server_address pada file **file_client.py** sesuai dengan ip server (alpine-1), ada 2 line code yang harus diubah

```
GNU nano 4.6 file_client.py
hasil = send_command(command_str)
if (hasil['status']=='OK'):
    #proses file dalam bentuk base64 ke bentuk bytes
    namafile= hasil['data_namafile']
    isifile = base64.b64decode(hasil['data_file'])
    fp = open(namafile,'wb+')
    fp.write(isifile)
    fp.close()
    return True
else:
    print("Gagal")
    return False

if __name__ == '__main__':
    server_address=('192.168.122.125',1111)
    remote_list()
    #remote_get('donalbebek.jpg')
```

5. Buat file baru yang berfungsi untuk melakukan 100 request get, disini digunakan file **multi_process.py** dari tugas 3 dengan sedikit modifikasi, untuk code lebih lengkap dapat dilihat pada github

```
GNU nano 4.6 multi_process.py
from file_client import remote_get
import time
import datetime
from multiprocessing import Process

def download_100x():
    texec = dict()
    urls = 'pokijan.jpg'
    catat_awal = datetime.datetime.now()
    for k in range(100):
        print(f"download ke {k}")
        waktu = time.time()
        #bagian ini merupakan bagian yang menginstruksikan eksekusi fungsi download
        texec[k] = Process(target=remote_get, args=(urls,))
        texec[k].start()

    #setelah menyelesaikan tugasnya, dikembalikan ke main process dengan join
    for k in range(100):
        texec[k].join()
    catat_akhir = datetime.datetime.now()
    selesai = catat_akhir - catat_awal
```

6. Pada server (alpine-1) jalankan **file_server.py**

The screenshot shows a terminal window with a dark background. At the top, there are window management icons and three tabs labeled 'alpine-1', 'alpine-2', and 'alpine-3'. The active tab is 'alpine-1'. The terminal prompt is `/home/Pemrograman_Jaringan_E/progjar4a #`. The user has entered the command `python3 file_server.py`. The output of the command is `WARNING:root:server berjalan di ip address ('192.168.122.125', 1111)`.

```
< |ole|
alpine-1 x alpine-2 x alpine-3 x
/home/Pemrograman_Jaringan_E/progjar4a # python3 file_server.py
WARNING:root:server berjalan di ip address ('192.168.122.125', 1111)
```

7. Pada Client (alpine-2) jalankan **multi_process.py**, client akan menjalankan request sebanyak 100x, dapat dilihat setiap request dari 0 sampai 99

```
< ole alpine-1 x alpine-2 x all > - x
```

```
WARNING:root:data received from server:
WARNING:root:sending message
download ke 97
WARNING:root:data received from server:
